LC Chiral Stationary Phase (CSP) Classification Diagram

Type	Description	Chemistry	Mechanism	Brands
I	Brush (Pirkle)	Low molecular weight chiral selectors Ionic or covalent bonding	Attractive interactions Hydrogen bonding Charge transfer ($\pi-\pi$ interaction) Dipole stacking	Chirex Sumichiral OA
II	Helical Polymers	Cellulose and amylose derivatives Poly methacrylates Poly acrylamides	Attractive interactives Insertion complexes	Lux Cellulose and Amylose
III	Cavity	Cyclodextrins, Crown ether	Inclusion complexes	Chiral CD-Ph Sumichiral OA
IV	Ligand Exchange	Amino acid-metal complex	Diastereomeric metal complex	Chirex Sumichiral OA
V	Protein	α -acid glycoprotein Bovine Serum Albumin	Hydrophobic interactions Polar interactions	Ultron ES
VI	Macrocyclic	Antibiotics Glycopeptides	Hydrogen bonding Charge transfer ($\pi-\pi$ interaction) Inclusion complexation Ionic interactions Peptide bonding	None
Other Types		Carbon-Based (Hypercarb) and Ceramic-based (Ceramospher)		

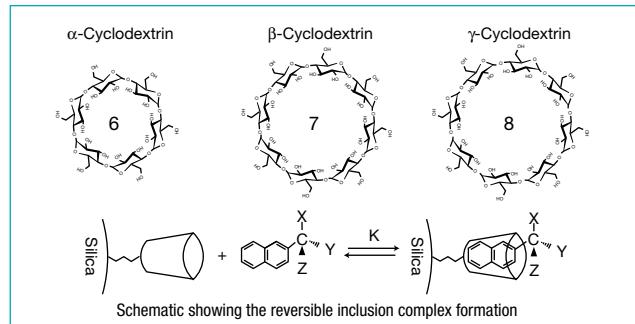

Type I Brush (Pirkle)

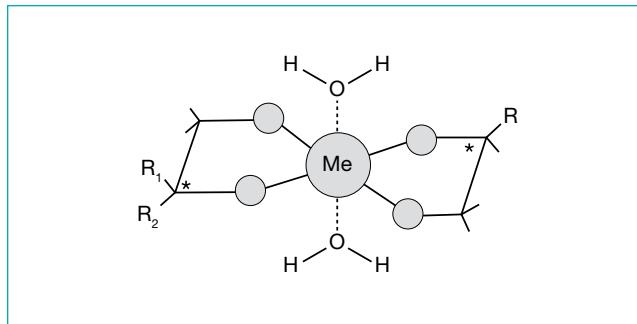

Type II Helical Polymers

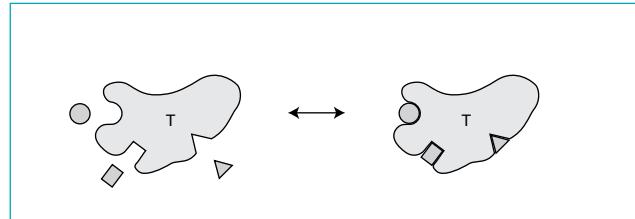

Type III Cavity

Type IV Ligand Exchange

Type V Protein

Ceramospher® and Chiral CD-Ph

By Shiseido Co., Ltd.

Ceramospher® Chiral Columns

- High-efficiency, pressure-stable ceramic-based materials
- Choice of normal or aqueous mobile phase conditions
- Enantioselectivity for acidic, basic and neutral chiral compounds
- High loadability combined with long column lifetimes

Based on 5 μm 40 Å spherical sodium magnesium silicate particles, Ceramospher phases RU-1 and RU-2 are novel materials for chiral HPLC separations. Enantiomer resolution is accomplished on an ion-exchange adduct of the base clay material in combination with an optically-active metal complex (based on ruthenium).

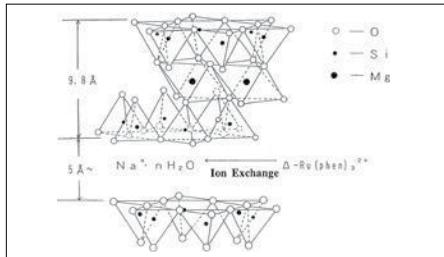

Ceramospher Phases

RU-1. Used for normal phase separations of a wide variety of chiral compounds, typical mobile phases include: 1% isopropanol-amine or dimethylamine in alcohol (methanol or ethanol) for basic compounds, and 1% acetic acid in alcohol for acidic compounds. Retention can be controlled by adding small percentages of hexane to these eluents.

RU-2. Treating the base material with a hydrophobic agent imparts excellent stability under aqueous conditions. Water is typically combined with methanol or acetonitrile in the mobile phase. When the content of water in the eluent is 30% or higher, the retention mechanism appears to be based on typical reversed phase partitioning; when water makes up 5% or less of the eluent, separations appear to be based on normal phase partitioning. Because of the long lifetime expected, this material is well suited for preparative use.

Call Phenomenex for a complete listing of Ceramospher chiral applications.

Ordering Information

Ceramospher and Chiral CD-Ph Chiral Columns

Part No.	Mfr. No.	Dimensions (mm)	Price
RU-1			
CHO-3904	50503	150 x 4.6	
CHO-3905	50504	250 x 4.6	
RU-2			
CHO-3906	50603	150 x 4.6

Chiral CD-Ph			
CHO-5862	80054	250 x 4.6	

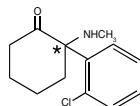

Chiral CD-Ph Columns

Made of precisely classified high-purity silica, this versatile chiral stationary phase is modified with phenylcarbamated β -cyclodextrin.

- Suitable for separation of basic, neutral, and amphoteric optical isomers
- Usable with both aqueous and non-aqueous mobile phases
- High durability
- High sample loadability

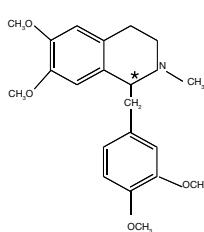

Ketamine

Column: Shiseido Ceramospher RU-1
Dimensions: 250 x 4.6 mm x 2 columns
Part No.: CHO-3905
Mobile Phase: Triethylamine/Methanol (1:100)
Flow Rate: 1.0 mL/min
Temperature: 50 °C
Detection: UV @ 254 nm

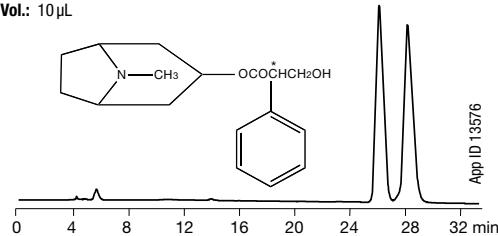

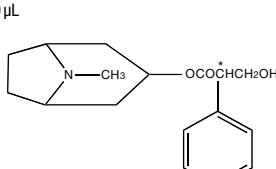

Laudanosine

Column: Shiseido Ceramospher RU-2
Dimensions: 250 x 4.6 mm
Part No.: CHO-3907
Mobile Phase: Diethylamine/Water/Acetonitrile (0.1:10:90)
Flow Rate: 0.5 mL/min
Temperature: 50 °C
Detection: UV @ 254 nm

Atropine

Column: Shiseido Chiral CD-Ph
Dimensions: 250 x 4.6 mm
Part No.: CHO-5862
Mobile Phase: 0.5 mol/L NaClO₄/CH₃CN (70:30)
Flow Rate: 0.5 mL/min
Temperature: 25 °C
Detection: UV @ 220 nm
Injection Vol.: 10 μL

- High enantioselectivity
- Fast run times
- Rugged, long-lived columns
- Easy scale-up to preparative
- Allow direct/indirect resolution of enantiomeric amines, amino acids, hydroxy acids, alcohols, carboxylic acids, ketones, ethers, and esters

Chiral separations are extremely important to the pharmaceutical and biotechnology industries, as well as most other areas of natural products chemistry. Optically active therapeutic drugs require selective and sensitive techniques. Government regulations also continue to spur and require the development of rapid, accurate and reproducible methods for the analysis and purification of enantiomeric compounds.

The challenge is to provide selective yet versatile HPLC columns for both trace analysis and the purification of bulk drug.

Phenomenex meets these challenges with Chirex brand HPLC columns. Chirex is available in 11 different stationary phases. These chemically rugged, versatile columns are used for the direct and indirect resolution of enantiomeric amines, alcohols, carboxylic acids, hydroxy acids, amino acids, ketones, lactones, ethers, esters, and other biologically active compounds.

Hundreds of applications demonstrate the performance of Chirex phases for a multitude of pharmaceutical and agrochemical compounds. For a complete list, please contact your Phenomenex technical consultant.

Which Chirex Stationary Phase?

Stationary phase selection depends on presence/absence of chemical groupings in the chiral molecule.

Chirex Column Selection Guide

Presence of Chemical Groupings in Chiral Molecule							Recommended Columns:		
Class	Aromatic	- N -	- COOH	- OH	Other	Comment	First Choice	Second Choice	Third Choice
Group 1	Y	Y	Y			Aromatic α -amino acids, α -hydroxy acids	3126	3005 or 3001	3011 or 3012
Group 2	Y	Y		Y			3022 or 3020	3014	3018
Group 3	Y	Y			Y		3014 or 3020	3022	3018
Group 4	Y		Y				3005	3010	3001
Group 5	Y			Y			3001 or 3014	3005	3020 or 3022
Group 6	Y				Y		3001	3005	3019 or 3020
Group 7		Y	Y			Aliphatic α -amino acids, α -hydroxy acids and their derivatives	3126		
Group 8			Y				3126	3010	3001
Group 9				Y			3014	3019 or 3020	3001
Group 10					Y	Asymmetric other than carbon. Chiral center at N,S,P,B, etc.	3014	3010	3005

Chiral Method Development Kits

Kit A. For Pharmaceuticals, Agrochemicals

The broad range of Pirkle-concept (Type I, or brush type) columns carefully chosen for this Kit will enable the chiral chromatographer to quickly and easily survey stationary phase utility and separation conditions for a wide variety of enantiomeric compounds. Used with normal phase solvent systems, these chiral columns are highly efficient tools particularly well-suited for enantiomeric separations of pharmaceuticals and agrochemicals.

Kit A. For Pharmaceuticals, Agrochemicals

This kit contains five columns, 50 x 4.6 mm:

Column 1:	Chirex 3001: 3,5-dinitrobenzoic acid derivative of (R)-phenylglycine
Column 2:	Chirex 3005: 3,5-dinitrobenzoic acid derivative of (R)-1-(naphthyl)phenylglycine
Column 3:	Chirex 3010: 3,5-dinitroaniline derivative of (S)-valine
Column 4:	Chirex 3014: (R)-1-(α-naphthyl)ethylamine derivative of (S)-valine
Column 5:	Chirex 3020: (R)-1-(α-naphthyl)ethylamine derivative of (S)-tert-leucine

Kit B. For α-Amino Acids, α-Hydroxy Acids, Carboxylic Acids, Aromatic Amines, Alcohols and Amino Alcohols

This Kit contains a collection of chiral columns for method development of enantiomeric α-amino acids, α-hydroxy acids, dipeptides, and aromatic amines, alcohols and amino alcohols. The kit includes four Pirkle-concept columns and one ligand-exchange type column. The Pirkle-concept columns are chosen for their high utility/versatility in separating derivatized amino acids, whereas the ligand-exchange column confers excellent enantioselectivity for underivatized α-amino acids, and α-hydroxy acids.

Kit B. For α-Amino Acids, α-Hydroxy Acids, Carboxylic Acids, Aromatic Amines, Alcohols and Amino Alcohols

This kit contains five columns, 50 x 4.6 mm:

Column 1:*	Chirex 3010: 3,5-dinitroaniline derivative of (S)-valine
Column 2:*	Chirex 3011: 3,5-dinitroaniline derivative of (S)-tert-leucine
Column 3:*	Chirex 3012: 3,5-dinitroaniline derivative of (R)-phenylglycine
Column 4:	Chirex 3014: (R)-1-(α-naphthyl)ethylamine derivative of (S)-valine
Column 5:	Chirex 3126: Ligand-Exchange type based on (N,S) diocetyl-(D)-penicillamine complexed with copper(II)

* Especially useful for derivatized amino acid analysis (see p. 329)

Lux[®] Chiral Columns

guarantee

Replace CHIRALCEL[®] and CHIRALPAK[®] Columns with Amazingly Good Lux Columns at a Fraction of the Cost!

Lux columns are guaranteed to perform similar to or better than the equivalent Chiral Technologies column of matching polysaccharide backbone and chiral selector. Lux phases can also provide alternative selectivity to other chiral selectors when separation is not achieved or when higher resolution is required.

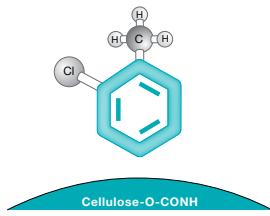

- High efficiency and loading capacity
- Stable in normal phase, polar organic, SFC, and reversed phase conditions
- 3 µm and 5 µm packed columns and 10 µm and 20 µm bulk media for scale up[†]

Technical Specifications

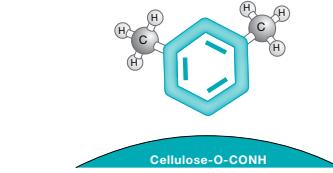

Particle Size	3, 5, 10 [‡] , 20 [‡] µm
pH Stability	2-9
Maximum Pressure	300 bar
Temperature Range	0-50 °C
Shipping Solvent	n-Hexane/2-propanol (9:1, v/v)
Switching Solvent	Methanol/Ethanol (9:1, v/v)

[†]Please inquire for availability

Lux columns offer a wide and complementary range of enantioselectivity for even the most difficult chiral separation projects. Our five distinct polysaccharide phases can resolve 92 % of your enantiomers*.

Lux Cellulose-1

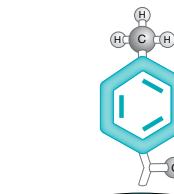

Lux Cellulose-1

Cellulose tris(3,5-dimethylphenylcarbamate)

Guaranteed Alternative to

CHIRALCEL OD[®], OD-H[®], OD-3, OD-RH, and OD-3R

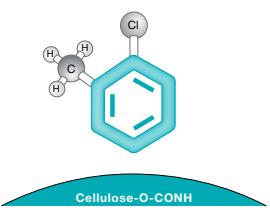

Lux Cellulose-3

Cellulose tris(4-methylbenzoate)

Guaranteed Alternative to

CHIRALCEL OJ[®], OJ-H[®], OJ-3, OJ-RH, and OJ-3R

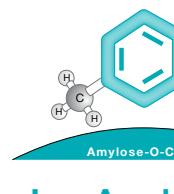

Lux Cellulose-2

Cellulose tris(3-chloro-4-methylphenylcarbamate)

Guaranteed Alternative to

CHIRALCEL OZ, OZ-H[®], OZ-3, OZ-RH, and OZ-3R

Lux Amylose-2

Amylose tris(5-chloro-2-methylphenylcarbamate)

Guaranteed Alternative to

CHIRALPAK AY[®], AY-H[®], AY-3, AY-RH, and AY-3R

* Based on 233 compounds screened on all five Lux phases

If Lux analytical columns (≤ 4.6 mm ID) do not provide at least an equivalent or better separation as compared to a competing column of the same particle size, similar phase and dimensions, send in your comparative data within 45 days and keep the Lux column for FREE.

Lux® Chiral Columns

Lux Chiral Stationary Phases

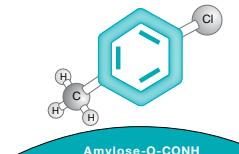

The Lux line of cellulose-based and amylose-based chiral stationary phases includes five complementary selectivities.

Lux Amylose-2: Chlorinated Amylose Chiral Selector

This first-to-market chlorinated amylose phenylcarbamate derivative offers complex chiral recognition components that greatly increase the chances of achieving chiral resolution.

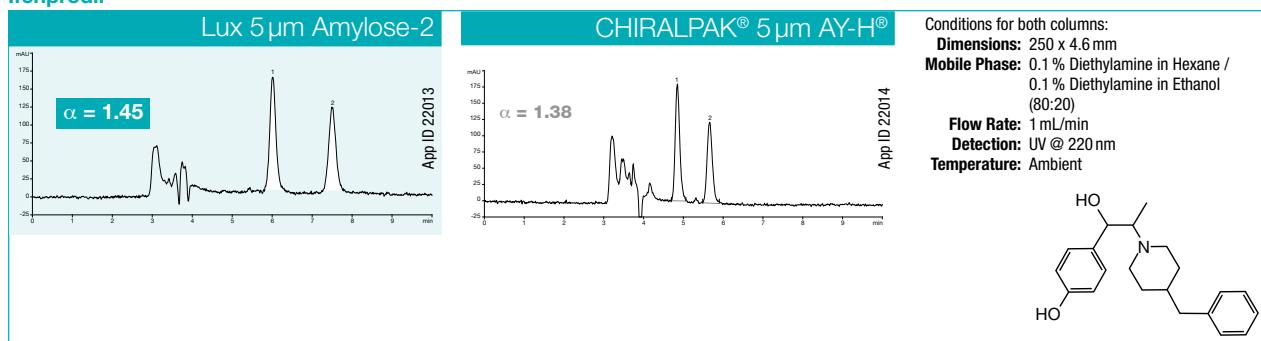

Excellent separation at a fraction of the cost.

Amylose tris(5-chloro-2-methylphenylcarbamate)

Ifenprodil

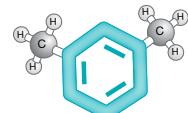

Lux Cellulose-1: Dimethyl Cellulose Chiral Selector

This universally trusted cellulose phenylcarbamate derivative is absolutely essential to any chiral screen. Guaranteed alternative to CHIRALCEL® OD-H®. Expect equivalent or better performance.

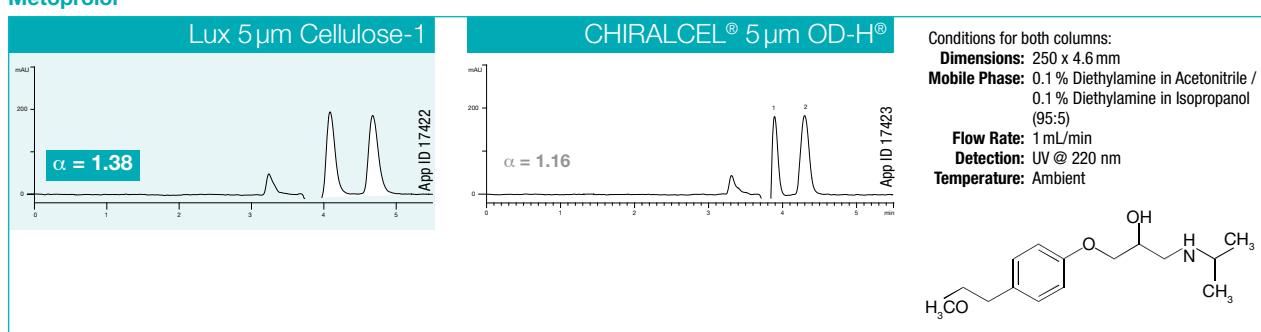

Excellent separation at a fraction of the cost.

Cellulose tris(3,5-dimethylphenylcarbamate)

Metoprolol

Comparative separations may not be representative of all applications.

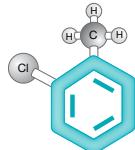

Lux® Chiral Columns

Lux Cellulose-2: Chlorinated Cellulose Carbamate Phase

This first-to-market halogenated cellulose phenylcarbamate derivative offers unique chiral recognition abilities that complement the rest of the Lux family of columns.

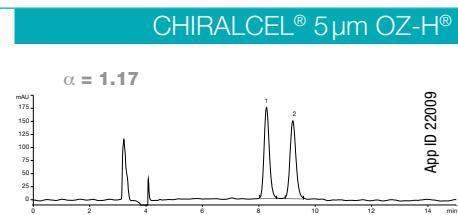

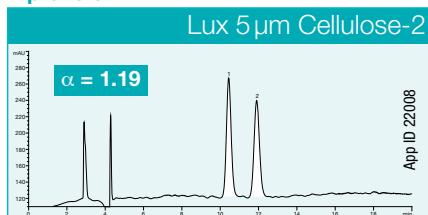

Excellent separation at a fraction of the cost.

Cellulose-O-CONH

Cellulose tris(3-chloro-4-methylphenylcarbamate)

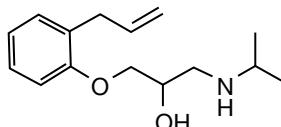

Alprenolol

Conditions for both columns:

Dimensions: 250 x 4.6 mm
Mobile Phase: 0.1 % Diethylamine in Hexane / 0.1 % Diethylamine in Ethanol (90:10)

Flow Rate: 1 mL/min
Detection: UV @ 220 nm
Temperature: Ambient

Lux Cellulose-3: Cellulose Ester Phase

Excellent separation at a fraction of the cost.

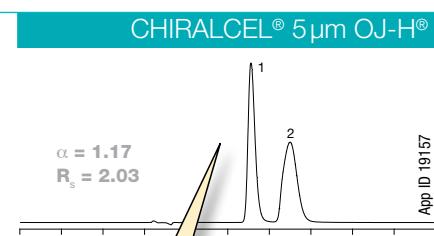

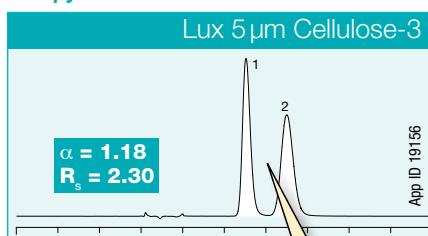

This cellulose methylbenzoate derivative offers distinct and complementary chiral recognition abilities.

CHIRAL LC | LUX

Cellulose tris(4-methylbenzoate)

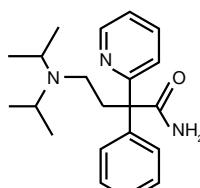

Disopyramide

Conditions for both columns:

Dimensions: 250 x 4.6 mm
Mobile Phase: 0.1 % Diethylamine in Hexane / 0.1 % Diethylamine in Ethanol (90:10)

Flow Rate: 1 mL/min
Detection: UV @ 220 nm
Temperature: Ambient

Comparative separations may not be representative of all applications.

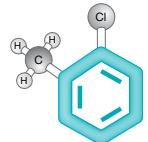

Lux® Chiral Columns

Lux Cellulose-4: Chlorinated Cellulose Carbamate Phase

This chlorinated cellulose phenylcarbamate derivative offers unique chiral recognition abilities.

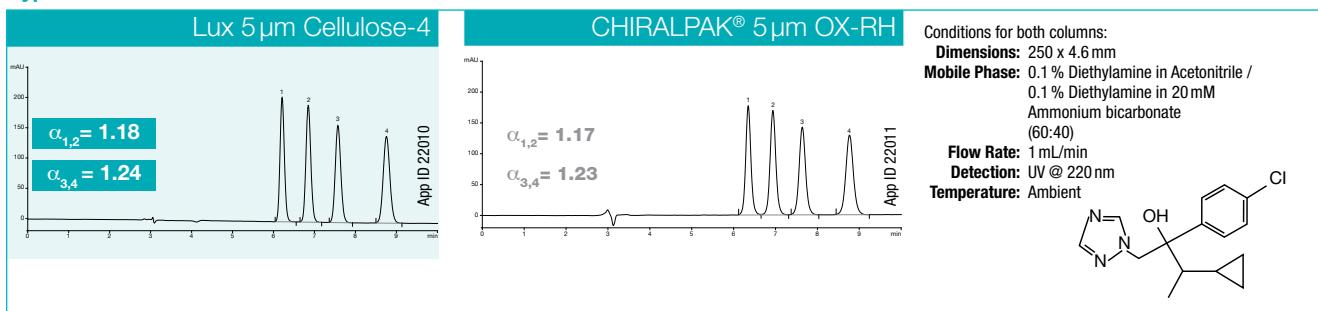

Excellent separation at a fraction of the cost.

Cellulose tris(4-chloro-3-methylphenylcarbamate)

Cyproconazole

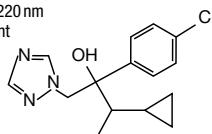

Comparative separations may not be representative of all applications.

Conditions for both columns:

Dimensions: 250 x 4.6 mm
Mobile Phase: 0.1 % Diethylamine in Acetonitrile / 0.1 % Diethylamine in 20 mM Ammonium bicarbonate (60:40)

Flow Rate: 1 mL/min
Detection: UV @ 220 nm
Temperature: Ambient

FREE Chiral Screening for HPLC and SFC

Have a sample and need a separation method? We can help!

Reliable methods and fast turnarounds are our specialty. Depending on compound type, we screen multiple chiral stationary phases under different conditions and return a detailed report of the recommended separation method so you can begin work right away.

We provide the following services:

Chiral Screening

- Normal Phase
- Reversed Phase
- Polar Organic
- SFC

Method Optimization Services

- Fast Turnaround
- Easy Method Transfer
- Continued Support

Preparative and Process Scale-Up

- Media Screening
- Small Scale Purification
- DAC Packing Assistance

Lux® Chiral Columns

Achieve Optimal Resolution by Screening All Five Complementary Lux Chiral Columns

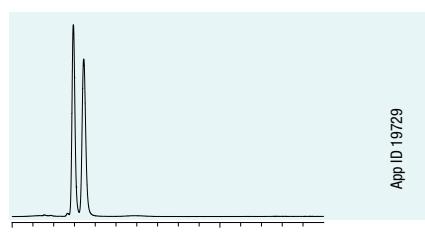

Utilizing differences in selectivity can help develop methods more efficiently by offering broad and contrasting chiral recognition abilities. Lux chiral selectors provide a variety of selectivities that give you the opportunity to screen for the ideal chiral separation.

Rabeprazole

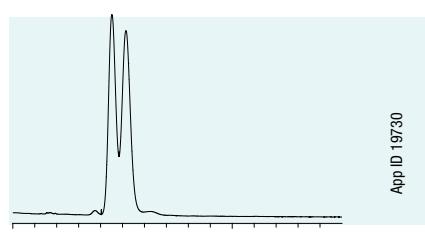

Lux 5 µm Amylose-2
 $\alpha = 0.00$

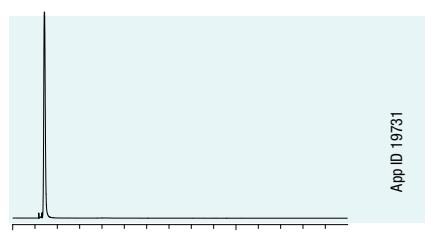

Lux 5 µm Cellulose-1
 $\alpha = 1.30$

Lux 5 µm Cellulose-2
 $\alpha = 1.19$

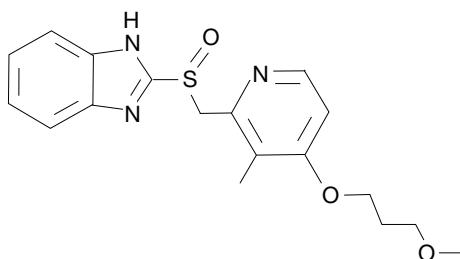

Lux 5 µm Cellulose-3
 $\alpha = 0.00$

Conditions for all columns:

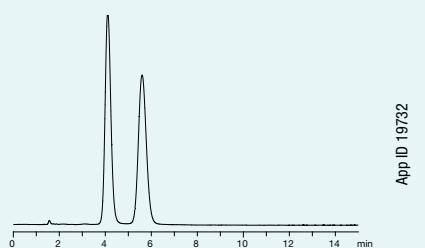

Dimensions: 150 x 4.6 mm
Mobile Phase: 0.1% Diethylamine in 10 mM Ammonium bicarbonate/0.1% Diethylamine in Methanol (80:20)

Flow Rate: 1.5 mL/min
Detection: UV @ 286 nm
Temperature: Ambient

Optimal Resolution

Lux 5 µm Cellulose-4
 $\alpha = 1.53$

Based on a five phase screen under reversed phase conditions, the optimal chiral stationary phase for resolving Rabeprazole is Lux Cellulose-4.

Comparative separations may not be representative of all applications.

Lux® Chiral Columns

guarantee

If Lux analytical columns (≤ 4.6 mm ID) do not provide at least an equivalent or better separation as compared to a competing column of the same particle size, similar phase and dimensions, send in your comparative data within 45 days and keep the Lux column for FREE.

Sumichiral OA™

By Sumika Chemical Analysis Service, Ltd.

- High chromatographic efficiency
- Rapid recovery from overload
- Wide range of applications in both normal and reversed phase*
- Pirkle-Type, Cavity-Type, and Ligand-Exchange-Type phases available

Ultron® ES

Manufactured by Shinwa Chemical Industries, Ltd.

- Two complementary protein-based chiral stationary phases
- Easy to use with reversed-phase mobile phases
- Racemic separation without derivatization
- pH range from 3.0 to 7.5
